

**QUESTÃO Nº 1****Diversity, creativity, and flexibility will be needed from the next generation of medical scientists**

Sir Robert Lechler  
Lancet (2017) 389:S1

There are interesting times ahead of us. Medical sciences are at the forefront of efforts to solve some of the biggest problems facing our society, including our ageing population, global poverty and health inequalities, and the impacts of climate change and antibiotic resistance. We live in an era in which advances in genetics and our increasing capacity in data and computing are rapidly changing the way we understand and treat disease. **Yet political upheaval and its associated uncertainty, a so-called post-truth society, increasing competition for funding, and the potential closing of borders pose a real threat to our progress.**

If we are going to solve the problems facing us, more than ever we will need to attract and retain the brightest and best minds. Looking at the Abstracts from our Spring Meeting gathered here, the extremely high calibre of the next generation of clinician scientists is clear to see.

Medical scientists of the future will need to be dynamic, creative, and forward thinking to deal with the complex challenges they face. More than ever they will need to participate in multidisciplinary teams, engage in team science, and will need to develop leadership skills to anticipate change, navigate their career pathway, and influence those around them.

To achieve all of this in an increasingly competitive landscape, there will be a temptation to work longer and longer hours to the exclusion of other interests. However, it is my own view, and that of the Academy of Medical Sciences, that this would be a short-sighted approach. Time outside of work has the potential to nourish creativity, build resilience, and give fresh perspective—precisely the skills that result in the best quality research.

So this year we are celebrating the importance of finding the right blend of outside interests alongside a career path in medical science in a new project called MedSciLife. The project is being launched at our Spring Meeting and in this special issue of *The Lancet*.

MedSciLife is an attempt to show the richness and diversity of working styles within our community and, perhaps most importantly, demonstrate that there is a life outside medical science. This is not an added extra—it is integral to who we are and the skills we must develop to be successful. The project is also an effort to show that medical scientists are not a homogeneous community, we are people from many different backgrounds living very different lives. Shining a spotlight on the person behind the labcoat or stethoscope, which is one of the key aims of MedSciLife, will help to

47 promote better working practices and should help to inspire the medical scientists of  
48 the future.

49

50 In this spirit, I wanted to share key components of my own MedSciLife. **My family is the**  
51 **most prominent feature of my life outside work.** I have five children, the youngest is 17  
52 and will be heading off to university next year. My second eldest son has made me a  
53 grandfather twice, my grandsons are 2.5 years and 6 months old and live in  
54 Manchester. **I don't get to see them as often as I would like, but we chat online.**

55

56 At school my best subjects were the arts; I chose science over arts simply because I  
57 wanted to study medicine, but humanities and arts remain an essential part of me, and  
58 my life is enriched when I am able to indulge in them. I am a closet artist, and love to  
59 sketch when I have time. **Staying in one place for hours at a time while looking intently**  
60 **at something I want to capture is a form of therapy and is often when I find the**  
61 **solutions to challenges in my work life.**

62

63 Nourishing and enriching my life outside of science has been essential to my career.  
64 When my life risks becoming dominated by work I feel quite unhealthy. Stepping out of  
65 my scientific world becomes necessary, and **for me travel can be a refuge.** My wife is  
66 Italian and Umbria is a special place for us where we can unwind and take things at a  
67 different pace. When travel isn't possible, **spending time with my family or**  
68 **appreciating fantastic art helps to restore my perspective and sense of humour—both**  
69 **of which are essential to weather the highs and lows of a career in medical science.**

70

71 I hope that MedSciLife will help those at all stages of their career to embrace the  
72 philosophy of celebrating different ways to blend life and work—giving us the chance  
73 to be the best we can now, and pave the way for an even better future

74

#### 75 **QUESTÕES (responda em português)**

76

77 **1. De acordo com o texto, as ciências médicas estão na vanguarda em questões**  
78 **relacionadas a grande problemas da atualidade, tais como envelhecimento da**  
79 **população, mudanças climáticas e resistência bacteriana. Do mesmo modo, quais**  
80 **são contextos atuais que têm dificultado a realização de pesquisas neste campo**  
81 **da ciência? (1,5)**

82 **(Linhas 13 a 15) Agitação política e a incerteza associada, a chamada "sociedade**  
83 **pós-verdade", o aumento da concorrência pelo financiamento, e o potencial**  
84 **fechamento das fronteiras.**

85

86 **2. O autor relewa seu "MedSciLife". Do que foi elencando no texto, o que você**  
87 **consideraria como factível em sua vida de pós-graduando? O que seria um**  
88 **desafio? (1,5)**

89 **(Linhas 48,49, 50, 58, 66, 67) O candidato deverá identificar pelo menos dois dos**  
90 **seguintes itens:**

91 **- Ficar com família o máximo possível e quando não for, utilizar chat por**  
92 **internet**

93 - Ficar em um lugar por horas observando ou capturando informações

94 - Aproximar-se das artes

95 - Viajar com a família

## QUESTÃO Nº 2

96

97

98 Microcephaly epidemic related to the Zika virus and living conditions in Recife,  
99 Northeast Brazil

100

101 Souza WV, Albuquerque MFPM, Vazquez E, Bezerra LCA, Mendes ADCG, Lyra TM,  
102 Araujo TVB, Oliveira ALS, Braga MC, Ximenes RAA, Miranda-Filho DB, Cabral Silva APS,  
103 Rodrigues L, Martelli CMT.

104 BMC Public Health. 2018 Jan 12;18(1):130. doi: 10.1186/s12889-018-5039-z.

105

106 **Background:** Starting in August 2015, there was an increase in the number of cases of  
107 neonatal microcephaly in Northeast Brazil. These findings were identified as being an  
108 epidemic of microcephaly related to Zika virus (ZIKV) infection. **The present study aims**  
109 **to analyse the spatial distribution of microcephaly cases in Recife (2015–2016), which**  
110 **is in Northeast Brazil, and its association with the living conditions in this city.**

111 **Methods:** This was an ecological study that used data from reported cases of  
112 microcephaly from the State Health Department of Pernambuco (August 2015 to July  
113 2016). The basic spatial unit of analysis was the 94 districts of Recife. **The case**  
114 **definition of microcephaly was: neonates with a head circumference of less than the**  
115 **cut-off point of –2 standard deviations below the mean value from the established**  
116 **Fenton growth curve.** As an indicator of the living conditions of the 94 districts, the  
117 percentage of heads of households with an income of less than twice the minimum  
118 wage was calculated. The districts were classified into four homogeneous strata using  
119 **the K-means clustering algorithm.** We plotted the locations of each microcephaly case  
120 over a layer of living conditions.

121 **Results:** During the study period, 347 microcephaly cases were reported, of which 142  
122 (40.9%) fulfilled the definition of a microcephaly case. Stratification of the 94 districts  
123 resulted in the identification of four strata. The highest stratum in relation to the living  
124 conditions presented the lowest prevalence rate of microcephaly, and the overall  
125 difference between this rate and the rates of the other strata was statistically  
126 significant. The results of the Kruskal-Wallis test demonstrated that there was a strong  
127 association between a higher prevalence of microcephaly and poor living conditions.  
128 After the first 6 months of the study period, there were no microcephaly cases  
129 recorded within the population living in the richest socio-economic strata.

130 **Conclusion:** **This study showed that those residing in areas with precarious living**  
131 **conditions had a higher prevalence of microcephaly compared with populations with**  
132 **better living conditions.**

133 **Keywords:** Zika, Ecological study, Socio-economic, Brazil

134

### 135 QUESTÕES (responda em português)

136 **1. Qual o objetivo do estudo? (1,0)**

137 (linhas 106 a 108) Analisar a distribuição espacial dos casos de microcefalia em  
138 Recife (2015-2016) e suas associações com as condições de vida nesta cidade.

139 **2. Como um caso de microcefalia foi definido? (1,0)**

140 (Linhas 111-114) recém-nascidos (ou neonatos) com a circunferência cefálica  
141 (da cabeça, do crânio) menor que o ponto de corte de 2 desvio-padrão menor que a  
142 média estabelecida na curva de crescimento de Fenton.

- 143 **3. Baseado nessa definição quantos casos ocorreram no local e período do**  
144 **estudo? (0,5)**  
145 (Linha 119) 142 casos
- 146 **4. Como os autores estratificaram as 4 categorias de “condições de vida”?**  
147 **(0,5)**  
148 (linhas 116-117). Pelo algoritmo de agrupamento K-médias
- 149 **5. Qual a conclusão do estudo? (1,0)**  
150 (linhas 128-130). Aqueles residindo em áreas com condições de vida precárias  
151 tinham um maior prevalência de microcefalia comparados com populações com  
152 melhor condições de vida.

**QUESTÃO Nº 3**

153  
154

155 HIV/AIDS, tuberculosis, and tobacco in Brazil: a syndemic that calls for integrated  
156 interventions

157 Novotny Thomas, Hendrickson Erik, Soares Elizabeth C. C., Sereno Andrea B., Kiene  
158 Susan M.. HIV/AIDS, tuberculosis, and tobacco in Brazil: a syndemic that calls for  
159 integrated interventions. Cad. Saúde Pública [Internet]. 2017 [cited 2018 Feb 02] ;  
160 33( Suppl 3 ): e00124215.

161 HIV/AIDS, tuberculosis (TB), and tobacco use are three important global health  
162 challenges. These epidemics act independently but also collectively, amplifying the  
163 health impacts of each. This synergism of diseases is termed “syndemic”. These three  
164 epidemics are usually approached through separate programs led by infectologists,  
165 pulmonologists, and behavioralists, respectively. The social determinants of disease,  
166 including poverty, low-education, high population-density, and cultural norms, are  
167 common to all three. The syndemic also challenges health systems and suggests that a  
168 systems-based approach may improve disease outcomes as well as practices.

169 There is evidence supporting linkages between HIV/AIDS, TB, and tobacco use. TB  
170 disease, mortality, and recurrent TB are associated with smoking. Smoking increases  
171 risk for latent TB infection (LTBI), progression to active disease, delayed sputum  
172 conversion, default from treatment, relapse, and drug resistance. Second-hand smoke  
173 may also increase risk of TB within households.

174 TB is the most important opportunistic infection for persons living with HIV/AIDS.  
175 HIV/AIDS is a risk factor for poor TB treatment outcomes and higher TB mortality.  
176 Persons living with TB have 1.6 times greater risk of progressing to AIDS and were 2  
177 times more likely to die compared with TB negatives. TB also increases HIV replication  
178 due to activation of latent virus in macrophages and T-lymphocytes and is associated  
179 with reduced CD4+ counts. In a Danish cohort, more than 60% of HIV/AIDS deaths  
180 were associated with smoking. Smoking among Persons living with HIV/AIDS increases  
181 risks for pneumonia as well as for oropharyngeal diseases. Smoking also increases risks  
182 for cardiovascular disease, dyslipidemia, insulin resistance, and chronic lung disease  
183 among persons living with HIV/AIDS. Nicotine has modulating effects on immune  
184 systems.

**185 Three intersecting epidemics in Brazil**

186 HIV/AIDS, TB, and tobacco are significant health challenges for Brazil, together  
187 accounting for 150,000 annual deaths. In 2013, there were 93,000 new TB and 760,000  
188 new HIV cases, with 13,000 co-infected. Expanded HIV diagnosis among TB patients is  
189 a priority in Brazil, and in 2013, 70% knew their HIV status compared with 31% in 2003.

190 Tobacco use is still a concern in Brazil, with 15% current adult smoking in 2013 and  
191 higher prevalence among those with lowest education (20.2%). A recent cohort study  
192 found that after controlling for socioeconomic status, smokers had 2.5 greater risk for

193 recurrent TB compared to non-smokers and that smokers were more likely to default  
194 on TB treatment. A 2014 Brazilian cohort study of 2,775 persons living with HIV/AIDS  
195 found 29.9% current smokers and 23.9% former smokers. Current smokers were more  
196 likely to be less educated; to use alcohol, crack, and cocaine; and to be hospitalized for  
197 co-existing conditions.

### 198 **A syndemic approach**

199 Traditional public health approaches usually involve single programs that do not  
200 address interactions of risks or diseases. A syndemic approach to HIV/AIDS and TB  
201 should integrate tobacco control in the care of patients with these conditions. At a  
202 minimum, improved overall health can be expected as a result of smoking cessation. A  
203 more comprehensive approach to the social determinants of tobacco use may also  
204 reduce combined effects of TB and HIV/AIDS.

205 New diagnoses of TB or HIV/AIDS are critical events for patients and could be linked to  
206 tobacco interventions. Newly diagnosed TB patients receive directly observed  
207 treatment short-course (DOTS), a patient-centered case management approach that  
208 requires regular provider contact for six months. This represents an opportunity to  
209 address tobacco use among patients and families. Similarly, patients diagnosed with  
210 HIV/AIDS and taking anti-retroviral treatment (ART) need significant clinical support to  
211 adhere to ART; they may be especially receptive to health interventions such as  
212 smoking cessation.

213 There have been multiple pilot studies on TB and cessation, including in Brazil, with  
214 randomized trials in Pakistan and South Africa. Brief advice and motivational  
215 interviewing were effective in reducing smoking among TB patients. A 2014 review of  
216 cessation interventions among persons living with HIV/AIDS indicated that these must  
217 take into account social context, mental health, and other risk behaviors. Multiple,  
218 varied interventions delivered consistently over time were most successful.

### 219 **Conclusion**

220 There is sufficient evidence that TB, HIV/AIDS, and tobacco use create synergistic  
221 disease burdens. Persons with TB and HIV/AIDS who use tobacco may not access  
222 health care or social supports necessary for health behavior change. They may not  
223 understand the impacts of tobacco use on their infectious diseases, and social norms  
224 may facilitate health risk behaviors. Add to this the impacts of poverty, dietary  
225 insufficiency, and crowding, and then the challenges to providing comprehensive care  
226 become clear. These factors may be best addressed using a systems-based approach.

227 Brazil has implemented effective TB and HIV/AIDS programs. These may be able to  
228 integrate low-cost tobacco control interventions, including cessation services,  
229 community participation, and outreach that can reduce tobacco use. To implement  
230 integrated tobacco control within TB and HIV/ AIDS programs, context-specific  
231 research and guidelines are needed. Policies that increase the price of cigarettes,  
232 reduce access to tobacco products, support smoke-free homes and workplaces,

233 publicize risks of tobacco use for TB and HIV/AIDS, and mandate cessation counseling  
 234 in DOTS and ART programs could impact the health of affected populations. However,  
 235 potential barriers and limitations include: gaining political authority to change policy  
 236 with DOTS and ART programs; engaging infectologists in the relevance of tobacco  
 237 control; and involving communities and families in a collective approach to tobacco  
 238 use among affected patients. Nonetheless, the benefits of a syndemic approach to  
 239 patients suffering from these conditions would likely far outweigh costs of  
 240 implementation.

241 Research to test integration of tobacco control within TB and HIV/AIDS programs  
 242 should involve the Family Health System in Brazil. In this system, geographically-based  
 243 Family Medicine teams involving physicians, nurses, practical nurses, and agentes  
 244 (community health workers) provide comprehensive care to targeted communities.  
 245 These teams can integrate care for multiple diseases and address community health.  
 246 Brazil has prioritized tobacco control as a national objective, with notable success in  
 247 the reduction of smoking prevalence from approximately 35% among adults in 1989 to  
 248 15% in 2013. This bodes well for an integrated approach to tobacco use among  
 249 populations affected by TB and HIV/AIDS. However, these populations will need more  
 250 than simple behavioral therapy to become smoke-free (Figure 1).

251 Figure 1

252 Recommendations: addressing the tuberculosis (TB), HIV/AIDS, and tobacco syndemic  
 253 in Brazil.

254 1. Implementation research is needed to address the syndemic of HIV/AIDS, TB, and  
 255 tobacco use in Brazil. Such research must take into account the common social  
 256 determinants of these conditions.

257 2. Behavioral interventions alone are insufficient to reduce smoking prevalence among  
 258 poor, marginalized, and highly vulnerable populations affected by TB and HIV/AIDS.  
 259 Comprehensive, policy-based approaches must be implemented in order to reinforce  
 260 clinical behavioral interventions as well.

261 3. Brazil's primary care-based health system and established tobacco control efforts  
 262 provide an appropriate setting to test interventions among highly-vulnerable  
 263 populations affected by the HIV/AIDS, TB, and tobacco syndemic.

264

265 **QUESTÕES** (responda em Português)

266 1- Explique o conceito de "*Sindemia*" de acordo com o autor (0,5)

267 *Sindemia é o sinergismo de doenças, nesse caso as três epidemias agem de forma*  
 268 *independente, mas também coletivamente, ampliando os impactos sobre a saúde de*  
 269 *cada uma.*

270 **2-** Segundo o autor quais são as barreiras, limitações e recomendações para o  
271 enfrentamento integrado dessas três doenças? (1,0)

272 **As barreiras e limitações potenciais incluem:** alcançar gestores públicos para mudar a  
273 política dos programas de tratamento supervisionado de Tuberculose e de  
274 acompanhamento da Terapia antiretroviral em pessoas vivendo com HIV/AIDS;  
275 envolvimento de infectologistas no controle do tabagismo; e envolvimento de  
276 comunidades e famílias em uma abordagem coletiva do tabagismo entre pacientes  
277 afetados, custos de implementação desse política pública (os benefícios de uma  
278 abordagem sindêmica para pacientes que sofrem dessas condições provavelmente  
279 superariam os custos).

280 **Recomendações:** abordar a tuberculose (TB), o HIV / AIDS e a sindemia de tabaco no  
281 Brasil.

282 **1.** Pesquisas operacionais ou de implementação que levasse em conta os  
283 determinantes sociais comuns dessas condições.

284 **2.** É necessário abordagens abrangentes e baseadas em políticas públicas devem ser  
285 implementadas ao mesmo tempo que intervenções comportamentais clínicas.

286 **3.** Aproveitamento da atenção básica e do programa brasileiro para abordagem ao  
287 tabaco fornecem um cenário adequado para testar intervenções entre populações  
288 altamente vulneráveis afetadas pelo HIV / AIDS, tuberculose e sindemia de tabaco.

289

290 **3-** De acordo com o texto qual o significado dos termos abaixo: (1,0)

291 a) Households: **membros da família (que vivem na mesma casa)**

292

293 b) Health: **saúde**

294

295 c) oropharyngeal diseases: **doenças orofaríngeas**

296

297 d) risk behaviors: **comportamento de risco**

298

299 e) physicians: **médicos**

300

301

302 **4- De acordo com o texto traduza o texto abaixo: (0,5)**

303

304 "Persons with TB and HIV/AIDS who use tobacco may not access health care or social  
305 supports necessary for health behavior change"

306

307 **"As pessoas com TB e HIV / AIDS tabagistas podem não ter acesso a cuidados de saúde  
308 ou apoio social necessários para a mudança de comportamento em saúde"**
